Pig Slaughterhouse

Waste water from the production line, containing blood, small pieces of bones, fat and meat, hairs and intestines.

Landia had to ensure proper mixing of the total volume and pumping to a RotoSieve rotating screen.

In the tank, a submersible pump with recirculating nozzle, type DG-I 5,5 kW with one fixed knife and a submersible mixer type POP-I 4, 0 kW – 300 rpm. were installed.

The system has been in operation since the beginning of 2001.
