

Flowmakers at the Rugby Wastewater Treatment Plant, UK

We have installed 8 flowmakers, type POPL-I, in the aeration tank at the municipal wastewater treatment plant in Rugby Newbold. The flowmakers create the specified velocity in the tanks which are equipped with bottom aeration. At the same time the sludge is homogenized and sedimentation is prevented.

The units have operated continuously since 1999.

Landia supplied mixers to the sludge tanks in 1989 and today a total of 30 Landia mixers and flowmakers operate at this plant.
