

SÆBY FISH PROCESSING PLANT

SLUDGE TANK MIXING AND PUMPING

The sludge is coming from the dewatering unit, includes polymers, and has a dry matter content of 15 %.

A Landia dry installed pompe type MPTKR-I 18,5 kW pump was installed.

The pump mixes the tank contents through a recirculation system and pumps the sludge to a tanker truck.

The pump was built with a special feeder propeller to make sure it could handle the high dry matter content.

The pump has been operating to full satisfaction of the customer since 2001.
