

Flowmakers at the Voreppe Wastewater Treatment Plant, France

We have installed 8 flowmakers, type POPL-I, in aeration tanks with bottom aeration – each tank is 9,000 m³. The flowmakers create the specified average velocity of 0.3 m/sec. The sludge is homogenized and sedimentation is prevented.

The plant has been in operation since 1994. The units have a total operating time of more than 80,000 hours.
